EXHAUST SYSTEM:

The ironer produces hot moist air (temp. 60°C) and combustible lint. Any machine must be connected to the exhaust line in compliance with all valid standards and regulations and it must be located in a well–ventilated room.
The design of the flue system shall be such that any a condensate formed when operating the appliance from cold shall either be retained and subsequently re–evaporated or discharged.
Do not install gas fired hot water boilers or the other gravity vented appliances in the same room.
Use exhaust ducts made of sheet metal or other noncombustible material with smooth internal surface for piping
The ironer requires an action related to air which replaced the air exhausted from the ironer. Opening(s) for air supply from outside of the building should be as close to the machine as possible.
Aerating opening for the make–up air supply required per each individual ironer is 0,13 m².
